Table of contents

Table of contents

Vector

A vector is a sequence of data elements of the same basic type

- Vectors allow the organisation of entities (e.g. numbers, characters. . .) along one dimension which can be indexed

```
height.girls <- c(178, 175, 159, 164, 183, 192)
height.boys <- c(181, 189, 174, 177)
```

```
height.girls[2]
```

```
## [1] 175
```

```
height.boys[3]
```

```
## [1] 174
```

Vector

- They can be combined:

```
(height <- c(height.boys, height.girls))
```

```
##  [1] 181 189 174 177 178 175 159 164 183 192
```

Vector continued

- They can be indexed logically (i.e. indexed by anything leading to a vector of booleans):

```
(height > 168)
```

```
##  [1]  TRUE  TRUE  TRUE  TRUE  TRUE  TRUE FALSE FALSE  TRUE
## [10]  TRUE
```

```
height[height > 168]
```

```
## [1] 181 189 174 177 178 175 183 192
```

```
height[!(height == min(height))]
```

```
## [1] 181 189 174 177 178 175 164 183 192
```

```
height[height != min(height)]
```

```
## [1] 181 189 174 177 178 175 164 183 192
```

Factors

- They work with other things than numbers:

```
sex <- c("girl","girl","girl","girl","girl", "girl",
"boy","boy","boy","boy")
sex <- factor(sex)
sex
```

```
##  [1] girl girl girl girl girl girl boy  boy  boy  boy
## Levels: boy girl
```

```
# Or
sex <- factor(c(rep("girl", times = 6),
                rep("boy", times = 4)))
# Or

sex <- factor(c(rep("girl", times = length(height.girls)),
                rep("boy", times = length(height.boys))))
```

Changing the order of levels of a factor

You have:

```
my_factor1
```

```
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
```

```
## [1] A A B B C
## Levels: C B A
```

Changing the order of levels of a factor

You have:

```
my_factor1
```

```
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
```

```
## [1] A A B B C
## Levels: C B A
```

You do:

```
## Using base:
my_factor2 <- factor(my_factor1, levels(my_factor1)[c(3, 2, 1)])
my_factor2
```

```
## [1] A A B B C
## Levels: C B A
```

Changing the order of levels of a factor

You have:

```
my_factor1
```

```
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
```

```
## [1] A A B B C
## Levels: C B A
```

You do:

```
## Using base:
my_factor2 <- factor(my_factor1, levels(my_factor1)[c(3, 2, 1)])
my_factor2
```

```
## [1] A A B B C
## Levels: C B A
```

Note: the order of levels influences the output of linear models and plotting functions (e.g. order in the legend of a ggplot) . . .

Changing the levels of a factor

You have:

```
my_factor1
```

```
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
```

```
## [1] A A A A D
## Levels: A D
```

You do:

```
## Using base:
levels(my_factor1)
```

```
## [1] "A" "B" "C"
```

```
my_factor2 <- my_factor1
levels(my_factor2) <- c("A", "A", "D") ## in same order!
my_factor2
```

```
## [1] A A A A D
## Levels: A D
```

```
## Using dplyr:
my_factor2 <- recode(my_factor1, A = "A", B = "A", C = "D")
my_factor2
```

```
## [1] A A A A D
## Levels: A D
```

Data frames

Data frames allow the organisation of entities as a matrix-like structure whose columns have the same length:

```
dataframe.ht <- data.frame(Height = height, Sex = sex)
dataframe.ht
```

```
##    Height  Sex
## 1     181 girl
## 2     189 girl
## 3     174 girl
## 4     177 girl
## 5     178 girl
## 6     175 girl
## 7     159  boy
## 8     164  boy
## 9     183  boy
## 10    192  boy
```

Data frames

It is good practice to always check their structure:

```
str(dataframe.ht)
```

```
## 'data.frame': 10 obs. of  2 variables:
##  $ Height: num  181 189 174 177 178 175 159 164 183 192
##  $ Sex   : Factor w/ 2 levels "boy","girl": 2 2 2 2 2 2 1 1 1 1
```

Data frames

You access the columns by means of the extractor $

```
height
##  [1] 181 189 174 177 178 175 159 164 183 192
rm(list = c("height", "sex")) # removing original vectors
height
## Error in eval(expr, envir, enclos):  object 'height' not found
dataframe.ht$Height #Or: with(data = dataframe.ht, Height)
##  [1] 181 189 174 177 178 175 159 164 183 192
```

⇒ What is the average height?

Data frames

Some functions can take a data frame as an input:

```
summary(dataframe.ht)
```

```
##      Height        Sex
##  Min.   :159.0   boy :4
##  1st Qu.:174.2   girl:6
##  Median :177.5
##  Mean   :177.2
##  3rd Qu.:182.5
##  Max.   :192.0
```

Note: this will be the case of a lot of functions performing statistical tests!

Data frames

How to compute the average height per sex?

- simple

```
mean(dataframe.ht$Height[dataframe.ht$Sex == "boy"])
```

```
## [1] 174.5
```

- more elegant

```
tapply(X = dataframe.ht$Height, INDEX = dataframe.ht$Sex,
       FUN = mean)
```

```
##   boy  girl
## 174.5 179.0
```

```
# Or: with(data = dataframe.ht, tapply(X = Height,
#   INDEX = Sex, FUN = mean))
```

- even more elegant but dangerous

```
library(dplyr)
dataframe.ht %>% group_by(Sex) %>% summarize(mean = mean(Height))  ## be aware of the rounding
```

```
## # A tibble: 2 x 2
##   Sex    mean
##   <fct> <dbl>
## 1 boy    174.
## 2 girl   179
```

Data frames

They can also be indexed:

```
dataframe.ht[1, ]
##   Height  Sex
## 1    181 girl
dataframe.ht[, 1]  # Or: dataframe.ht[, "Sex"]
##  [1] 181 189 174 177 178 175 159 164 183 192
```

Data frames

They can be edited:

```
dataframe.ht[1, 1]
```

```
## [1] 181
```

```
dataframe.ht[1, 1] <- 171.3
dataframe.ht[1, 1]
```

```
## [1] 171.3
```

```
dataframe.ht$linenumber <- 1:nrow(dataframe.ht)  # add column
ncol(dataframe.ht) # try dim()
```

```
## [1] 3
```

```
dataframe.ht$linenumber <- NULL  # remove column
ncol(dataframe.ht)
```

```
## [1] 2
```

Data frames

They can be edited with dpylr way

add column with `mutate()`

```
dataframe.ht <- dataframe.ht %>% mutate(linenumber = 1:nrow(dataframe.ht))
head(dataframe.ht, n= 3)
```

```
##   Height  Sex linenumber
## 1  171.3 girl          1
## 2  189.0 girl          2
## 3  174.0 girl          3
```

Data frames

They can be edited with dpylr way

add column with `mutate()`

```
dataframe.ht <- dataframe.ht %>% mutate(linenumber = 1:nrow(dataframe.ht))
head(dataframe.ht, n= 3)
```

```
##   Height  Sex linenumber
## 1  171.3 girl          1
## 2  189.0 girl          2
## 3  174.0 girl          3
```

select columns with `mutate()`

```
dataframe.ht.sex <- dataframe.ht %>% select(Sex)
head(dataframe.ht.sex, n= 3)
```

```
##    Sex
## 1 girl
## 2 girl
## 3 girl
```

Data frames

They can be edited with dpylr way

add column with `mutate()`

```
dataframe.ht <- dataframe.ht %>% mutate(linenumber = 1:nrow(dataframe.ht))
head(dataframe.ht, n= 3)
```

```
##   Height  Sex linenumber
## 1  171.3 girl          1
## 2  189.0 girl          2
## 3  174.0 girl          3
```

select columns with `mutate()`

```
dataframe.ht.sex <- dataframe.ht %>% select(Sex)
head(dataframe.ht.sex, n= 3)
```

```
##    Sex
## 1 girl
## 2 girl
## 3 girl
```

select rows with `mutate()`

```
datafrane.ht.female <- dataframe.ht %>% filter(Sex == "girl")
head(datafrane.ht.female, n= 3)
```

```
##   Height  Sex linenumber
## 1  171.3 girl          1
## 2  189.0 girl          2
## 3  174.0 girl          3
```

reshaping data frame

you have wide data:

```
head(my_df1)
```

```
##    age4  Sex linenumber age1  age2  age3
## 1 171.3 girl          1 71.3 146.3 161.3
## 2 189.0 girl          2 89.0 164.0 179.0
## 3 174.0 girl          3 74.0 149.0 164.0
## 4 177.0 girl          4 77.0 152.0 167.0
## 5 178.0 girl          5 78.0 153.0 168.0
## 6 175.0 girl          6 75.0 150.0 165.0
```

```
dim(my_df1)
```

```
## [1] 10  6
```

you want long data:

```
head(my_df2)
```

```
##    Sex  Age Height
## 1 girl age1   71.3
## 2 girl age1   89.0
## 3 girl age1   74.0
## 4 girl age1   77.0
## 5 girl age1   78.0
## 6 girl age1   75.0
```

```
dim(my_df2)
```

```
## [1] 50  3
```

reshaping data frame

you have wide data:

```
head(my_df1)
```

```
##    age4  Sex linenumber age1  age2  age3
## 1 171.3 girl          1 71.3 146.3 161.3
## 2 189.0 girl          2 89.0 164.0 179.0
## 3 174.0 girl          3 74.0 149.0 164.0
## 4 177.0 girl          4 77.0 152.0 167.0
## 5 178.0 girl          5 78.0 153.0 168.0
## 6 175.0 girl          6 75.0 150.0 165.0
```

```
dim(my_df1)
```

```
## [1] 10  6
```

you want long data:

```
head(my_df2)
```

```
##    Sex  Age Height
## 1 girl age1   71.3
## 2 girl age1   89.0
## 3 girl age1   74.0
## 4 girl age1   77.0
## 5 girl age1   78.0
## 6 girl age1   75.0
```

```
dim(my_df2)
```

```
## [1] 50  3
```

you do:

```
my_df2 <- my_df1 %>% gather("Age", "Height", -Sex) %>% arrange(Age)
```

reshaping data frame

you have wide data:

```
head(my_df1)
```

```
##    age4  Sex linenumber age1  age2  age3
## 1 171.3 girl          1 71.3 146.3 161.3
## 2 189.0 girl          2 89.0 164.0 179.0
## 3 174.0 girl          3 74.0 149.0 164.0
## 4 177.0 girl          4 77.0 152.0 167.0
## 5 178.0 girl          5 78.0 153.0 168.0
## 6 175.0 girl          6 75.0 150.0 165.0
```

```
dim(my_df1)
```

```
## [1] 10  6
```

you want long data:

```
head(my_df2)
```

```
##    Sex  Age Height
## 1 girl age1   71.3
## 2 girl age1   89.0
## 3 girl age1   74.0
## 4 girl age1   77.0
## 5 girl age1   78.0
## 6 girl age1   75.0
```

```
dim(my_df2)
```

```
## [1] 50  3
```

you do:

```
my_df2 <- my_df1 %>% gather("Age", "Height", -Sex) %>% arrange(Age)
```

one row = one observation, one column = one variable

joining data frame

```
# df_to_merge1 <- my_df2 %>% mutate(ID = imap_chr(paste("ID", seq))
```

you have df1:

```
 # head(my_df2)
dim(my_df2)
```

```
## [1] 50  3
```

you have df2:

```
head(my_df2)
```

```
##    Sex  Age Height
## 1 girl age1   71.3
## 2 girl age1   89.0
## 3 girl age1   74.0
## 4 girl age1   77.0
## 5 girl age1   78.0
## 6 girl age1   75.0
```

extanding data frame

cheating data frame

plenty of informative cheatsheets on: `https://www.rstudio.com/resources/cheatsheets/`

Lists

Lists allow the organisation of any set of entities into a single R object:

```
list.ht <- list(girls = height.girls, boys = height.boys)
list.ht
```

```
## $girls
## [1] 178 175 159 164 183 192
##
## $boys
## [1] 181 189 174 177
```

Lists

Lists can also be indexed and their elements extracted:

```
list.ht$girls
## [1] 178 175 159 164 183 192
list.ht["boys"]  # still a list
## $boys
## [1] 181 189 174 177
list.ht[["boys"]]  # vector
## [1] 181 189 174 177
list.ht[[2]][3]
## [1] 174
```

Lists

Some functions can take a list as an input:

```
lapply(list.ht, FUN = mean)
```

```
## $girls
## [1] 175.1667
##
## $boys
## [1] 180.25
```

Summary

```
dataframe.ht
```

```
##    Height  Sex linenumber
## 1   171.3 girl          1
## 2   189.0 girl          2
## 3   174.0 girl          3
## 4   177.0 girl          4
## 5   178.0 girl          5
## 6   175.0 girl          6
## 7   159.0  boy          7
## 8   164.0  boy          8
## 9   183.0  boy          9
## 10  192.0  boy         10
```

```
list.ht
```

```
## $girls
## [1] 178 175 159 164 183 192
##
## $boys
## [1] 181 189 174 177
```

Summary

- `data.frame`
  - All columns have same length
  - Each column can have its own class (e.g. `numeric`, `factor`, `character`)
- `list`
  - Each element can have its own length
  - Each element can have its own class (e.g. `numeric`, `factor`, `character`)
