Using data in R test

Alexandre Courtiol

June 2018

You have:

```
my_factor1
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
## [1] A A B B C
## Levels: C B A
```

You do:

```
## Using base:
my_factor2 <- factor(my_factor1, levels(my_factor1)[c(3, 2, 1)])
my_factor2
## [1] A A B B C
## Levels: C B A
```

Note:
the order of levels influences the output of linear models and plotting functions (e.g. order in the legend of a ggplot) . . .

Changing the levels of a factor

<div style="display: flex; justify-content: space-between;">

You have:

```
my_factor1
## [1] A A B B C
## Levels: A B C
```

You want:

```
my_factor2
## [1] A A A A D
## Levels: A D
```

</div>

You do:

```r
## Using base:
levels(my_factor1)

## [1] "A" "B" "C"

my_factor2 <- my_factor1
levels(my_factor2) <- c("A", "A", "D") ## in same order!
my_factor2

## [1] A A A A D
## Levels: A D

## Using dplyr:
my_factor2 <- recode(my_factor1, A = "A", B = "A", C = "D")
my_factor2

## [1] A A A A D
## Levels: A D
```
